

PROP.COM · PROPCCHAIN

Between Capital and the Asset

Who sits in the middle, what must stay independent, what becomes a service, and in what order we go after each.

THE SETUP

Two businesses work the same stretch of the market

PROP.COM · OUTCOME SERVICES

Cash flow now, records as a by-product

Formerly an investment and asset manager, now the outsourced desk for managers: underwriting, reporting, asset management, debt advisory. Sold as outcomes, delivered faster and cheaper than an in-house team because the desk work is progressively automated. Margin funds Propchain.

PROPCHAIN · RAILS

The standard, adopted by everyone

Structuring, attestation and agent identity. Its value is that other managers, lenders, notaries, valuers and auditors run on it, including the ones Prop.com competes with. A long build that needs the parties in the middle on the rails. The mandate market is one mechanic that runs on it.

THE QUESTION THIS DECK ANSWERS

Some twenty parties sit between capital and the asset. For each: do we own it, tool it, or onboard it? And in which order, so that Prop.com's services and Propchain's adoption pull each other forward instead of competing for the same attention.

THE RULE

Every party in the middle splits into an act, a process and data

THE ACT

Carries the liability

A signature, a deed, an audit opinion, a valuation mark, a registry entry. Its value comes from being independent of the transaction.

Stays independent. We tool it.

THE PROCESS

Prepares the act

Data rooms, models, document review, evidence packs, draft deeds, KYC files, reporting runs. Desk work on structured data; usually most of the hours and the fee.

Becomes a Prop.com service.

THE DATA

Consumed and emitted

Rent rolls in, NOI out. Comparables in, a mark out. A closing set in, a title transfer out. Every act and every process reads and writes records.

Propchain attests it.

Why this beats a box-by-box call. "Lawyers are independent" is true of the opinion and false of the data room. "Valuers are independent" is true of the signature and false of the model. The split says which part we can own without breaking the trust the act depends on.

Why the act must stay independent. Large assets, large figures, real liability. An opinion or a deed issued by the party that profits from the transaction is worth less to a buyer, a lender or a regulator, whatever its quality. Independence is the product.

THE RULE APPLIED · CAPITAL AND TRANSACTION SIDE

What stays, what moves, what is attested

Party	Act · stays independent	Process · Prop.com service	Data · Propchain attests
Investment manager	Investment decision, fiduciary	Underwriting, models, IC papers, screening	Asset vector, mandate
Fund administrator	Licensed administration	NAV, fund accounting, investor reporting	NAV, ownership, cash
Transfer agent	Register of record	Register upkeep, subscriptions, redemptions	Unit holder register
Auditor	Audit opinion	Audit-ready ledger, evidence packs	Proof of State per period
Depository	Ownership, cash verification	Verification feeds, exception reports	Ownership, cash movements
Lender	Credit decision, capital	Debt advisory, financing packs, covenants	Credit box, loan register
Broker, originator	Relationship, market colour	Screening, teasers, data rooms, process	Listing, bids, outcome
Valuer	Signed valuation	Model, comparables, data preparation, AVM	Mark, inputs, lineage

Two of these are not intermediaries. The investment manager and the lender are participants, capital rather than middle: we serve the first as a client and onboard the second as a counterparty, so both reappear in the priority lists with different verbs.

Licence requirements vary by jurisdiction; Germany and Luxembourg assumed.

THE RULE APPLIED · SETTLEMENT AND ASSET SIDE

From the closing table to the building

Party	Act · stays independent	Process · Prop.com service	Data · Propchain attests
Lawyers	Opinion, negotiation, privilege	Data rooms, DD summaries, red flags, drafting	DD findings, documents
Technical, ESG DD	Inspection, professional sign-off	Report assembly, capex model, ESG data	Condition, capex, ESG
Notary	Deed, identity, consent	Draft deed, KYC pack, closing set	Deed, settlement event
Registry	State record of title	Filing preparation only	Title state, mirrored
Escrow, payments	Holding client money (bank)	Payment orchestration, rents, distributions	Cash events, reconciliations
Asset manager	Strategy toward the investor	Business plans, budgets, arrears, vendors	Performance, leasing
Property, facility	Site operations, tenants	Rent roll, service charges, ledger desk	Rent roll, ledger: source
Vendors	The physical work	Procurement, vendor scoring, invoice control	Works, costs, lettings

The last two rows are where the source data lives. Rent rolls and ledgers are the raw material for NOI, and NOI is what every mandate, credit box and valuation runs on. We do not need to own property management to own its records; we need its records on the rails.

Vendors: developers, contractors, letting agents, insurers.

Eight layers, in the order a deal moves

Layer	Parties	Whiteboard	Independence	Our verb
1 Participants	LPs, GPs, lenders, buyers, sellers, tenants	Participants	The market itself	Onboard, serve
2 Origination	Brokers, originators, placement, debt advisers	Market	None required	Serve, then automate
3 Pricing	Underwriting, valuers, data providers	Pricing	The valuer's signature	Serve, tool the valuer
4 Verification	Technical, ESG and legal DD, KYC and AML	—	Inspection and opinion	Serve, tool
5 Guardrails	Lawyers, auditor, depositary, AIFM, regulator	Guardrails	The act, in full	Tool, serve the prep
6 Settlement	Notary, registry, escrow bank, payment rails	Settlement, Flow	State and bank	Tool, never own
7 Administration	Fund admin, transfer agent, reporting, servicing	—	The licence holder	Serve via partner
8 Performance	Asset, property and facility managers, vendors	Performance	None required	Serve desk, integrate site

Three corrections. Settlement is notary, registry and escrow moving together. Guardrails include auditor, depositary and AIFM. Performance splits into decisions and operations.

Two layers were missing. Verification and administration hold the desk hours and produce the records behind Proof of State. Least visible, most automatable.

THE MAP

Every party gets one verb

Prop.com is itself a participant on the rails, with no privileged access: see the neutrality slide.

We sell the outcome of a desk, not the AI

THE PITCH TO A MANAGER

Replace four or five analyst seats with an outsourced desk that delivers the same underwriting and reporting faster, at lower fixed cost, with less overhead. A leaner firm, not a software licence.

WHY NOT ADVERTISE AI

The client buys certainty and a lower cost base. How we produce it is our margin, and it improves every quarter. Naming the tooling invites a procurement of tooling: the wrong conversation.

Seat in a manager	Desk share of the role	Prop.com service line
Acquisitions analyst	Very high: models, IC papers	Underwriting
Fund controller	Very high: accounts, NAV	Reporting, controlling
Reporting, IR	Very high: quarterlies	Reporting, controlling
Asset manager	High: budgets, monitoring	Asset management desk
Debt, treasury	High: packs, covenants	Debt advisory
ESG officer	High: data, disclosures	DD report assembly
Technical, project	Medium: site time remains	DD report assembly
In-house legal	Medium: opinion remains	Legal process ops
Property management	Low: site, tenants remain	Property mgmt desk

Desk share: qualitative estimate of hours on documents and data rather than people and sites.

Five criteria decide the order we sell in

Service line	FTE density	Desk share	Licence barrier	Data yield	Margin	Tier
Underwriting	High	Very high	None	Asset vector	Now	1
Reporting, controlling	High	Very high	None	NOI, state proofs	Now	1
Asset management desk	High	High	None	Performance	Now	1
Debt advisory	Medium	High	None	Credit boxes	Now	1
Fund admin and TA	High	Very high	Partner licence	NAV, register	Next	2
DD report assembly	Medium	Medium-high	Sign-off outside	Condition, ESG	Next	2
Legal process ops	Medium	Medium-high	Opinion outside	DD findings	Next	2
Payment operations	Low	Very high	Bank partner	Cash events	Next	2
Property mgmt desk	High	Low overall	None	Rent roll, ledger	Later	3

FTE density: seats a mid-size manager carries. **Desk share:** hours on documents and data. **Licence barrier:** a regulated act in the way. **Data yield:** what the work produces for Propchain. **Margin:** how soon automation makes it profitable at outsourced pricing. Origination is displaced by the market, not scored.

Ratings are qualitative and relative to each other, not measured.

Three tiers: desk, licensed desk, field

TIER 1 · NOW

Underwriting, reporting, asset management desk, debt advisory

The analyst seats: the densest cluster in any investment team and the purest desk work, with no licence in the way. The output is the asset vector and periodic NOI, which every credit box, mandate and valuation later consumes. Already live in our own operations.

TIER 2 · NEXT

Fund admin and TA, DD assembly, legal process, payments

As automatable as Tier 1, but each has a regulated act in the way: the AIFM's licence, the engineer's or lawyer's sign-off, the bank's client money. We deliver the process under a named partner's act. Entry is through Tier 1 clients: same manager, one more desk.

TIER 3 · LATER, BY INTEGRATION

Property and facility management, origination

Physical and relationship work with a thin desk layer. We want the records, not the headcount: rent rolls and ledgers are the source of every NOI. Integrate property managers onto the rails; take the desk where the portfolio is already ours. Origination is displaced by the market.

Land and expand inside one client. Tier 1 replaces the seats the manager most wants gone and installs our records as theirs. Tier 2 then sells to a client whose data we already hold, which makes outsourced administration cheap to deliver and hard to leave.

Sequence by what each party unlocks

Party	Gatekeeper for	What their presence unlocks	Tailwind	Order
Lenders	The debt book, certainty of close	Credit boxes, financed bids, pair quotes	Speed	1
Valuers	The price signal LPs and lenders trust	Attested marks; Proof of State gains credibility	Regulated	2
Notaries	Settlement: identity, capacity, consent	A closing set that executes; last mile to registry	E-notarisation	3
Auditors, depositaries	Periodic and ongoing assurance	Audit-ready state; LP-facing credibility	Supervision	4
Other managers	Breadth: a standard needs peers	Liquidity in the mandate market	Cost pressure	4
Property managers	Source data: rent roll, ledger	Fresh NOI; decay works in our favour	Reporting load	5
Lawyers	Deal execution quality	DD outputs as structured findings	Weak	6
Registry	Finality of title	The end state; mirrored until then	State pace	Later

Gatekeeper asks what the party alone can make true. **Unlocks** asks which next party or mechanic becomes possible once they are on. **Tailwind** is the external reason to move now. Cost to integrate is lowest where a party already runs a system we connect to rather than replace: lenders and managers low, property managers high.

Qualitative. E-notarisation refers to the German development flagged internally; scope to be confirmed.

PROPCHAIN · THE SEQUENCE

Each party makes the next one worth adding

01

Lenders

Credit boxes rest on the platform. Every asset with attested NOI now carries a debt quote.

02

Valuers

Marks on attested inputs. LTV tests run on marks lenders already trust.

03

Notaries

A closing set the notary executes against. Financed, marked pairs settle without re-verification.

04

Assurance and peers

Auditors and depositaries read the same records. Other managers join because their lenders did.

05

Source and finality

Property managers feed data in; lawyers land DD as fields; the registry connects last.

Dependency, not rank. A notary is more important to a deal than a lender, but a notary tool with nothing to settle is a demo. For pairs that already carry a financed bid and a mark, it is a closing.

Where Prop.com feeds in. Steps 01, 02 and 04 are reached through Tier 1 clients: their lenders, valuers and auditors. The engagement is the introduction; the records are why the party stays.

Tools for acts that stay theirs

Party	The tool	What they get	What we get
Notary	Machine-readable closing set: KYA identities, draft deed from attested data, escrow instructions, filing package	Hours off every closing; no re-verification	Settlement event with lineage
Valuer	Attested input feed with lineage, platform comparables, model workspace; the signature stays theirs	Faster, defensible marks	Marks with provenance
Auditor	Continuous evidence pack: ledger, reconciliations, state proofs per period, permission log	Full population instead of sampling	Opinion on platform state
Depository	Ownership and cash verification feed with exception reporting	Verification without manual confirmation	Independent check of state
Lawyers	Structured DD workspace: data room from records, findings as fields, drafting from platform data	Cheaper DD that reconciles to the asset record	DD as attributes, not PDFs

Pricing rule. Tools for independents are free or near-free. Adoption is the product; revenue is in the services around them and the data every act leaves.

Design rule. The tool never produces the act. It prepares, presents and records it. A tool that drafts a deed is fine; one that purports to execute it is a liability.

HOW THE TWO BUSINESSES PULL EACH OTHER

Services make records; records make rails

THE LINE THAT MAKES THE REST POSSIBLE

Prove the exchange never reads the book

THE TENSION

Other managers must run on Propchain or it is not a standard. Prop.com competes with those managers for their clients' desks, and the mandate market runs on the same platform. Nobody rests a mandate on rails whose operator's sister company can see it.

The same reason the notary must stay independent applies to us.

- 01 **Prop.com is a participant.** Same KYA identity, same permissions as any manager. No privileged or bulk read.
- 02 **Proof of Permission is the evidence.** Every read of a mandate, credit box or asset is logged and attributable.
- 03 **Models train on anonymised aggregates only.** Published policy, checked against the same log.
- 04 **Governance sits with Propchain.** Standards, permissions and access are set on the rails side with external parties present.

Why it is in a strategy deck. Every competing manager, and every lender and auditor who serves them, asks this in the first meeting. A design answer wins the meeting; a reassurance loses it. It is also the case for keeping the two businesses visibly distinct in name and governance.

THE PLAN ON ONE PAGE

Own the desk. Tool the act. Onboard the market.

NOW

- Sell Tier 1 desks as outcomes
- Onboard clients' lenders as credit boxes
- Specify the notary closing set
- Publish the neutrality and data policy

Decide: which partner licence anchors Tier 2.

NEXT

- Tier 2 under partner licences
- Valuers on attested inputs
- Auditors on the evidence pack
- Mandate market on the internal book

Decide: first notary partner and jurisdiction.

LATER

- Property managers integrated, not bought
- Origination desk replaced by the market
- Depositary feed; lawyers via DD fields
- Registry connection when the API exists

Decide: how separate Prop.com and Propchain are in name and governance.
